Summary

The android application provides information about the amount of Carbon monoxide emitted in different countries, in last decade.

Why a Mobile Application?

A mobile application would be really helpful for fast access to organized and reliable data. It would be easier to have most of information at one place than to search all over the internet.

List of Basic Features

1. Selection of country users wants see the information about.
2. Data comparison between two countries.
3. Data unit conversion.

Expected User/Market

Environmentalists can use this app to compare their status of work efficiency in their specific country. Country officials may look up the application for their country's progress in reducing pollutant emission. They could compare their country with neighboring countries for further curbing the emission of pollutants. Anyone can take inspiration from the data of amount of pollutants emission and might start doing something positive to reduce pollution. Students could also use the data to create their projects or reports.

Screenshots

Here are some screenshots of how the application's user interface will most likely look like.
